

Internship Project Brief

Date:

Project: Intern Portfolio Readiness Scorer

This project is designed to help Graphura evaluate how job-ready interns are by analyzing their portfolios, projects, skills, tools, and presentation. Interns will use Data Analytics to build a scoring framework and AI/ML to predict employability and readiness for industry roles.

Business Objective

To create a data-driven system that objectively evaluates intern portfolios, identifies top-performing interns, improves training outcomes, and supports hiring, placement, and employer branding initiatives at Graphura.

Problem Statement

Portfolio quality is currently evaluated manually and subjectively, making it difficult to consistently assess intern readiness for industry roles. Graphura requires a standardized scoring and analytics system that can measure portfolio quality, predict employability, and provide actionable feedback for improvement.

Part 1: Data Analytics (Evaluation Framework)

Step 1: Define Portfolio Evaluation Criteria

Interns will design a scoring framework based on key dimensions such as Project Quality, Technical Skills, Documentation, Presentation, Business Impact, and Consistency. Each category will be scored on a scale of 1 to 10 and combined into a weighted Portfolio Readiness Score.

Step 2: Data Collection from Intern Portfolios

Structured data will be collected from GitHub repositories, Google Drive folders, reports, dashboards, and portfolio websites. Fields will include Intern Name, Role, Number of Projects, Tools Used, Documentation Quality, Business Relevance, and Presentation Score.

Step 3: Scoring & Benchmarking

A composite Portfolio Score will be calculated using weighted metrics. Interns will be categorized as Job Ready, Almost Ready, or Needs Improvement. Benchmarking will be done across departments and internship batches.

Step 4: Portfolio Analytics Dashboard

Interns will build a dashboard to display KPIs such as Average Portfolio Score, Top Performers, Department-wise Readiness, and Common Skill Gaps. This dashboard will provide management with clear insights into intern quality.

Part 2: Data Science & AI/ML (Prediction & Intelligence)

Step 5: ML Problem Definition

The machine learning objective is to predict how likely an intern is to succeed in industry placement based on portfolio attributes. The model will output a Readiness Score (0–100) and categorize interns into Job Ready, Almost Ready, or Needs Improvement.

Step 6: Feature Engineering

Input features will include number of projects, average project score, tools used, documentation completeness, business relevance, presentation quality, and task consistency. These will be transformed into numerical features for modeling.

Step 7: Model Building

Interns will train classification models such as Logistic Regression, Decision Trees, or Random Forest. The dataset will be split into training and testing sets, and performance will be evaluated using accuracy and confusion matrices.

Step 8: Recommendation System

The system will automatically generate a final Readiness Score, highlight strengths and weaknesses, and provide personalized improvement recommendations for each intern's portfolio.

Final Deliverables

1. Portfolio Evaluation Rubric 2. Structured Portfolio Dataset 3. Portfolio Readiness Scoring Model 4. AI/ML Readiness Prediction Notebook 5. Interactive Dashboard 6. Final Business Report (PDF)
Business Impact: Objective evaluation of intern performance, identification of top interns for hiring or referrals, improved training outcomes, stronger employer branding, and a scalable framework for measuring internship success
